Task Distribution Matrix

1. Backend (The Orchestrator)

- **API Infrastructure:** Build the RESTful API to handle document uploads and communication between the mobile app and the AI engine.
- **Knowledge Graph Management:** Implement the logic to store and retrieve contract relationships (using a graph database like Neo4j or a relational DB with graph-like queries).
- **Authentication & Storage:** Securely store user legal history and metadata.
- **Integration:** Connect the "Clash Engine" logic with the database to check new uploads against historical data.

2. AI & Data Analysis (The Brain)

- **NLP Pipeline:** OCR (for scanned contracts) and text extraction or Gemini 2.5 Flash.
- **Topic Classification:** Vector Search/Text embeddings compared to pre-defined labels and classes with KNN.
- **Sneaky Clause & Liability Detection:** Develop the logic to identify "predatory" language and assign the Predatory Score. Using a multi-agent system with a prosecutor and a reviewer to minimize LLM hallucination.
- **The Clash Engine:** Develop the logic that compares the embeddings or keywords of the new contract against the stored Knowledge Graph.
- **Visual Contract Diff:** Develop a before-and-after changes comparison between a contract and its renewal version.
- **Data Analysis:** Structure the "Risk Heatmap" data, turning raw text into a 1–10 numerical risk scale.

3. Mobile & Frontend (The Interface)

- **Document Scanner/Uploader:** Create a clean interface for users to upload files or take photos of physical contracts.
- **Landing page:** Create a landing page introducing the app and leading the user to the download link.

- **Visual Contract Diff (4.6):** Build the UI component that highlights text differences (red/green highlights).
- **Risk Heatmap Visualization (4.5):** Design the dashboard that shows the "Predatory Score" using intuitive colors (Green for safe, Red for danger).

4. UI/UX Designer (The Experience)

- **User Interface:** Design intuitive and responsive interfaces for key features, ensuring clarity and ease of navigation.
- **Legal-to-Simple UX:** Legal tech is scary for most users. The designer must make the "Risk Heatmap" look helpful, not intimidating.
- **Branding:** Create the "Aegis Veritas" identity and the "Veritas Shield" logo.
- **Presentation Design:** Since this is a hackathon, the final pitch deck is as important as the code. The designer should lead the visual storytelling for the demo.
